Stakeholder & Partnership Brief

Document 07 of 08 · VISION & STRATEGY

M A D HALO Technologies

Where the Project Currently Is

HI NGE SIYANI has an early functional prototype (built with Base44), and a more serious, long-term version is now in active development using Delphi 12 FMX with Supabase as the backend. Core features currently in place or in progress: user onboarding and profiles, language selection and switching, multilingual text interaction with the AI assistant Siyani, and initial education and public-service use cases, in an initial set of five languages (English, isiZulu, Sepedi, Tshivenda, Xitsonga).

Where We Are Going

The project is working toward a fuller, voice-enabled, more comprehensive multilingual ecosystem — with stronger language quality (backed by native-speaker validation), broader education and public-service coverage, and eventually, support for more South African languages, low-data/offline access, and deeper partnerships that extend what the ecosystem can reliably help with.

What We Are Building

A multilingual digital ecosystem, centred on the AI assistant Siyani, that helps South Africans access education, opportunities, and public-service information in the language they're most comfortable with. It's built on the principle that language should never be the reason someone gets left behind — hence the name, HI NGE SIYANI.

What Kind of People/Organisations We May Need

- Co-founders and collaborators with complementary skills (language, education, public-service knowledge, technical development)
- Advisors with experience in ed-tech, gov-tech, AI, or South African language work
- University and research partners for language validation and future language/speech model work
- Community organisations with reach into the communities the project is meant to serve
- Schools and education organisations who can help validate and distribute education-related content
- Technology partners for infrastructure, data, and eventually integrations

Potential Role of My Partner

As co-founder, working alongside MAD on the direction, execution, and growth of the project — this includes shaping product decisions, expanding partnerships, and helping steer the project as it moves from prototype to a more established platform.

Potential Role of Advisors

Providing guidance and credibility in specific areas the founding team may not have deep expertise in — for example, education systems, government/public-service processes, South African linguistics, AI ethics, or

fundraising/organisational growth. Advisors don't need to be involved day-to-day; their value is in periodic, informed input at key decision points.

Potential Role of Universities/Researchers

Supporting the language and data strategy directly — validating terminology and content, contributing linguistic expertise, and potentially collaborating on future language/speech model development. Universities may also see HI NGE SIYANI as a meaningful applied research and community-impact opportunity in its own right.

Potential Role of Community Organisations

Helping ground the project in real community needs, providing feedback from the people HI NGE SIYANI is meant to serve, and helping the ecosystem reach communities that a purely digital-marketing approach wouldn't reach — particularly rural or lower-connectivity communities.

Potential Role of Schools/Education Organisations

Helping validate that education-related guidance is accurate, current, and genuinely useful to students — and potentially serving as an early, trusted channel for introducing students and families to the platform.

Potential Role of Technology Partners

Supporting infrastructure needs as the platform scales (hosting, data, possibly future AI/speech technology partnerships), and potentially collaborating on future integrations with education or government information sources.

A Note for Anyone Joining or Supporting This Project

HI NGE SIYANI is not built to be "an AI chatbot." It's built to solve a specific, real problem — that language and access barriers keep South Africans from opportunities and services they're entitled to. Every partnership, feature, and decision should be weighed against that mission: does this help make sure no one is left behind because of the language they speak or the access they have?
