

CORE PROJECT DOCUMENTATION PACK

Product Roadmap

Document 02 of 08 · VISION & STRATEGY

M A D HALO Technologies

This roadmap is meant to stay realistic and useful over time, not to impress in a single pitch. Phases are directional, not fixed dates — each phase is completed when its goals are genuinely met, not on a calendar deadline.

Phase 1 — Current

Focus: Prove the core experience works, in text, in a handful of languages.

- Existing Base44 prototype (early, functional, proof-of-concept stage)
- Active development of the serious/live version in Delphi 12 FMX with Supabase as the backend
- Multilingual text interaction with Siyani
- User authentication and profile creation
- Language selection at onboarding, with the ability to change language at any time
- Core education and public-service use cases (a working, if not exhaustive, set)
- Establishing the underlying AI/content architecture — how Siyani accesses, verifies, and delivers information
- Defining the initial language set: English, isiZulu, Sepedi, Tshivenda, Xitsonga

Phase 1 is complete when: a user can sign up, choose a language, ask Siyani real education or public-service questions in that language, and get accurate, useful answers — reliably.

Phase 2 — Next

Focus: Deepen quality, add voice, start building outside validation.

- Voice input and output for Siyani
- Stronger, more accurate support across the initial South African languages (not just "supported," but genuinely well-supported)
- More comprehensive education functionality (a wider range of pathways, institutions, and opportunity types)
- Better government/public-service navigation (more processes covered, clearer guidance)
- Language quality testing and improvement, ideally with native-speaker review
- Partnerships with universities and language researchers
- Structured user feedback and evaluation loops
- **(Addition)** Basic analytics/monitoring to understand where Siyani gives poor or uncertain answers, so quality gaps are visible rather than assumed away
- **(Addition)** A lightweight content moderation and correction process, so incorrect information can be flagged and fixed quickly

Phase 2 is complete when: Siyani works well by voice and text in its core languages, has been reviewed by native speakers, and has a real feedback loop with users.

Phase 3 — Long-Term

Focus: Scale language coverage, reach, and resilience.

- Custom or fine-tuned language and speech capabilities where it genuinely makes sense (not training a large model from scratch — see the Language & Data Strategy document)
- Additional official South African languages beyond the initial five
- Low-data and offline-friendly capabilities for rural and lower-connectivity users
- Wider integrations (e.g. with education institutions, government information sources, community organisations)
- Community-driven improvement — communities contributing to language quality, content accuracy, and coverage
- Expansion into a broader digital ecosystem beyond the current scope

(Addition) Long-term sustainability planning — how the project is funded and maintained once it moves beyond active founder-led development, since public-interest infrastructure like this needs a plan for continuity.

A Note on Sequencing

Language quality and trust come before feature breadth. It's better for HI NGE SIYANI to genuinely work well in five languages than to nominally "support" eleven languages poorly — because poor-quality answers in someone's home language can do more harm to trust than not offering that language at all yet.
