M A D HALO Technologies

These are practical, grounded examples of how different people could use HI NGE SIYANI. Some reflect current capabilities; others reflect the future direction of the project — each is labelled accordingly.

1. A Student Seeking Education/University Guidance

(Current-capability use case)

A matric student in Limpopo isn't sure what subjects or marks they need for a particular university course, and doesn't have easy access to someone who can explain it clearly. They open HI NGE SIYANI, ask Siyani in Xitsonga, and get a clear, understandable explanation of the requirements and next steps — including where to go to confirm details officially.

Connection to the mission: A student's future shouldn't depend on whether they happen to know someone who can explain the system to them in a language they understand.

2. A Young Person Looking for Opportunities

(Current-capability use case)

A young job seeker wants to know what learnerships, bursaries, or entry-level opportunities might be relevant to them. Instead of searching through scattered, English-only websites, they ask Siyani directly, in their preferred language, and get pointed toward relevant, current opportunities.

Connection to the mission: Opportunity should be something you can find and understand — not something you stumble into only if you're already well-connected or fluent in English.

3. Someone Trying to Understand a Government/Public Service

(Current-capability use case, expanding over time)

Someone needs to understand a public-service process — for example, what documents they need for a particular application. Instead of navigating confusing official language or long queues just to get basic clarity, they ask Siyani, get a plain-language explanation, and are pointed toward the correct official source to confirm and complete the process.

Connection to the mission: Government services exist for everyone — but only if people can actually understand how to access them.

4. Someone Who Prefers Xitsonga, Sepedi, Tshivenda, or isiZulu

(Current-capability use case — this is the foundation of the whole project)

A parent more comfortable in Sepedi than English wants to understand something about their child's education options. Rather than relying on translation apps or waiting for someone else to explain it, they interact with Siyani directly in Sepedi and get a natural, clear answer.

Connection to the mission: This is the most direct expression of "we will not leave each other behind" — meeting people in the language they already think and feel comfortable in.

5. Someone Who Eventually Uses Voice Instead of Typing

(Future use case — planned, not yet built)

A user who is less comfortable typing, or who is using their device while doing something else, speaks their question to Siyani instead and receives a spoken response in their chosen language.

Connection to the mission: Not everyone is equally comfortable with typing or reading long text — voice removes another layer of exclusion, once it's built.

6. A Rural / Low-Connectivity User

(Future use case — planned, not yet built)

Someone in an area with limited or unreliable internet connectivity is still able to get meaningful help from HI NGE SIYANI, thanks to low-data or offline-friendly capabilities developed in a later phase.

Connection to the mission: Being "left behind" is often as much about infrastructure and connectivity as it is about language — this use case is where the mission extends beyond language alone.

The Common Thread

Every one of these situations describes a person who, today, might reasonably give up, guess, or go without — not because they lack ability, but because the information wasn't built for them. HI NGE SIYANI exists to close that gap, one language and one use case at a time. That's what "we will not leave each other behind" means in practice.
